Silent Weapons for Quiet Wars: An Introductory Programming Manual Oct 08 2020 This is the top secret manual said to be found by accident in 1986 by an employee of Boeing Aircraft. He bought a surplus IBM copier for scrap parts at a government sale and found the manual inside. The manual outlines a plan to control the masses through manipulation of industry, education and politics, and to divert the public's attention from what is really going on. Surprisingly, it is claimed that much of what is outlined has come to pass, and makes interesting reading for those exploring the deeper levels of our social structure and how it may be controlled or influenced. This Book Tree edition includes all of the important charts and diagrams not seen in other versions. It is an exact replica of the original, aside from some minor alterations to correct print quality. Found in this edition only is a new, four-page Introduction. It explains why we may never be certain of the true origin of this document, despite the fact that someone has stepped forward and claimed that they assembled it from multiple sources.

Ada for Multi-Microprocessors Oct 20 2021 Multi-processor systems are becoming more prevalent due to the many advantages which they offer over single-processor systems. A multi-microprocessor system can smoothly accommodate expansion and increasing levels of integration of separate controllers, facilitating modernization of industrial plants without large capital outlay. This book deals with the ways in which Ada can be used for such distributed systems. The main part of the book is devoted to the issue of how to construct and run an Ada program for a variable target configuration of several microcomputers, interconnected through shared memories, multi-access busses, local area networks or end-to-end lines. It is recognized that Ada and current Ada Programming Support Environments (APSEs) do not address distributed targets, and different approaches are therefore considered for coping with distribution without changing the language or unduly restricting the way in which it is used. The approach which emerges as the most natural is one where the designer is required to cluster tightly coupled Ada tasks into 'virtual nodes'. The implications of this approach for the user and the APSE are examined in detail, and further implications concerning use of the multi-microprocessor approach to achieve reliability and extensibility are also studied.
